

# K-DVST OHNE REGLER

Pressure booster without regulator

**HANSA FLEX**

## Caracteristici

|                               |                                                                                                     |
|-------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Presiune de intrare</b>    | 2 - 10 bar                                                                                          |
| <b>Presiune de ieșire</b>     | Max. 20 bar (regulated: max. 16 bar)                                                                |
| <b>Domeniu de temperaturi</b> | -10 °C to +50 °C (40 mm bore), -10 °C to +60 °C (63 mm bore)                                        |
| <b>Medii</b>                  | Filtered, unlubricated or lubricated compressed air (if lubrication is used, it must be continuous) |
| <b>Material de etanșare</b>   | NBR                                                                                                 |
| <b>Regulator de presiune</b>  | With plastic body                                                                                   |
| <b>Carcasă</b>                | Aluminium, anodised                                                                                 |
| <b>Teavă</b>                  | Anodised aluminium jacket                                                                           |
| <b>Montaj</b>                 | Any position, with 4 mounting holes                                                                 |
| <b>P2:P1</b>                  | 2:1                                                                                                 |

## Indicație

For information about calculating the filling times for different tank sizes, refer to the above-mentioned data sheet available on our website  
Alte date sunt disponibile la cerere.

## Descriere

Pressure multipliers (boosters) allow a separate compressed air store with up to double pressure to be installed for selected devices in a compressed air system without an external energy source, i.e. it is possible to work with a maximum pressure of 20 bar in a standard 10 bar system (maximum ratio 2:1). This is achieved using a double piston, which is operated by a combination of integrated check valves in such a way that the booster works automatically until the target pressure is reached in a compressed air tank and is then automatically switched off. A tank is always required to build up the pressure and store the compressed air!

## Informații suplimentare

Fixing bracket with nut
